

Vitran Worker App – Detailed Functionality Document

Vitran is a smart and simple solution designed to make daily distribution easier for both business owners and workers. For the owners, it provides clear visibility into sales, cash, and returns without any confusion. For the workers, it's like a digital assistant that guides them through every step of their day – from starting with the stock they carry in the morning, to recording deliveries, handling payments, and finally closing the day with a complete summary. This document walks through the app in the same sequence a worker would experience it, ensuring that even someone who has never seen the app can easily understand how it works and why it makes life simpler.

1. Login Screen

The very first step is secure login. Each worker uses their unique Worker ID and password. This ensures all deliveries, payments, and returns are tied only to the right worker. Once logged in, the worker enters the main flow of the app.

2. Morning Stock Entry

Here, the worker records all the items they are carrying for the day. This becomes the starting point against which all deliveries and returns are tracked. For example, if the worker notes down 10 packets of Product A, the app will use that number to check deliveries and calculate any returns later.

3. Customer Delivery Screen

This screen shows the list of customers for the day, divided into B2B (shops, businesses) and B2C (end consumers). The worker enters how much of each product they deliver. For B2B customers, the app auto-calculates the payment amount. For B2C, it only tracks delivery. This ensures accuracy while making the worker's job simple.

4. Cash Details Screen

Once deliveries are done, the worker enters the actual cash received. Instead of typing just the total, they record it exactly how they received it: for example, 4 notes of ₹500 and 2 notes of ₹100. The app then checks that this total matches the payments calculated earlier. If not, the worker cannot move forward. This prevents errors or mismatches.

5. Return Stock Screen

At the end of the route, the worker's unsold stock is auto-calculated by the app. For instance, if they had 10 packets in the morning and delivered 8, the app shows 2 as returned. This removes manual effort and avoids mistakes.

6. Daily Summary Screen

The final screen is a complete overview of the day. It shows total stock taken in the morning, total delivered, total returned, and total payments collected. Once confirmed, the worker submits it, and the entire day's report is sent to the backend for the owners to review.

In short, Vitran is more than just an app – it's a partner for both the worker and the owner. The worker gets an easy-to-use, step-by-step guide through their day, while the owner gets accurate and reliable data without chasing for reports. With Vitran, distribution becomes smoother, faster, and free of errors – making every day's work easier for everyone involved.
