

Vitran Worker App – Functionality Walkthrough

Vitran is designed to make life simpler for both workers and owners in the distribution business. For owners, it provides complete visibility into sales, payments, and returns. For workers, it acts like a step-by-step guide through their day — making sure nothing is missed, all numbers match up, and the day ends with everything neatly summarized. What follows is a complete journey of the worker app, explained in detail, so even someone who has never seen it before will understand how it works and why it makes such a difference.

1. Login Screen

The very first thing a worker sees is the login screen. Here, they put in their Worker ID and Password. Why? Because every worker has their own deliveries, their own stock, and their own payments. We can't afford to mix that up, so login ensures everything is tied to the right person. Once logged in successfully, the worker is inside the app and ready to start the day.

2. Morning Stock Entry

After login, the first task is always to record the stock they're carrying for the day. Think of this like saying: "Okay, today I'm leaving the warehouse with 10 packets of Product A, 5 liters of Product B, and 20 boxes of Product C." The worker enters these numbers in the Morning Stock Entry screen. Why this matters: This entry becomes the baseline. Whatever they deliver and whatever they return later is calculated against this number. Basically, the app is saying: "Cool, I've noted what you're carrying. Now let's track where all this goes today."

3. Customer Delivery Screen

Now the real work begins. The worker heads out to deliver. When they open the Customer Delivery Screen, they see a list of customers assigned for that day. The app divides them into B2B (like shops, businesses) and B2C (end consumers). Here's what happens: - For each customer, the worker enters how many units of each product they delivered. - If the customer is B2B, the app automatically calculates the payment amount. - If the customer is B2C, it just records delivery — no money math involved. Why the difference? B2B is handled like proper business invoices, so we track payments. B2C is retail — sometimes prepaid, sometimes not — so we just care about product count. Example: - Worker delivers 5 packets of Product A to a shop (B2B). If each packet is ■100, the app shows total payment = ■500. - Next, worker gives 2 packets of Product A and 1 box of Product C to a household (B2C). The app just notes the delivery, no payment displayed. So by the time all deliveries are entered, the app has a full record of who got what and, for B2B, how much they owe/paid.

4. Cash Details Screen

Now comes money. The worker goes to the Cash Details Screen and records the actual cash collected. But instead of just typing "■2200", they enter it like how they actually receive it: - 4 notes of ■500 - 2 notes of ■100 = ■2200 Why so detailed? Because in the real world, reconciliation matters. If the app already calculated total B2B payments as ■2200, then the cash they enter must also add up to ■2200. If it doesn't match, the app won't let them move forward. This way, no mistakes slip through.

5. Return Stock Screen

After all deliveries and cash are done, the worker needs to say what's left with them. But here's the beauty — they don't have to type anything. The Return Stock Screen calculates it automatically. How? Return Stock = Morning Stock – Delivered Stock. So if they had 10 packets in the morning and delivered 8, the app directly shows 2 as returned. This prevents errors and makes sure everything balances properly.

6. Daily Summary Screen

Finally, the worker sees the Daily Summary. This is like a report card of their day. It shows: - Total stock they started with. - Total delivered. - Total returned. - Total payment collected. It's basically the complete picture: "Today, you carried this much, you delivered this much, you brought back this much, and you collected this much." Once they review and confirm, the day is submitted and synced to the backend for admins to see.

Why This Flow Matters

The whole app is built so that the worker doesn't have to think too much. They just follow the journey step by step, and the app handles all the calculations, validations, and cross-checks in the background. - No manual totals. - No risk of stock mismatch. - No chance of cash vs. delivery mismatch. It makes the worker's life simple, while giving the business 100% accurate data for the day.

In conclusion, Vitran is not just another app — it's a companion for the worker on the ground and a reliable source of truth for the owner. By guiding the worker step by step, it ensures smooth operations and zero errors. By summarizing everything at the end of the day, it gives owners peace of mind. Vitran helps both sides win — workers get simplicity, owners get clarity. And that's exactly why it makes such a difference in daily distribution.
